Hallo@all

I got a problem with Tomcat. I am developping a web service based on jsf, and using tomcat as container.

My problem is if i start Tomcat in Eclipse, the default root path is D:\Programme\Apache Software Foundation\Tomcat 5.5\webapps\myproject

however if i start tomcat through tomcat configuration directly, the default root path changed to D:\Programme\Apache Software Foundation\Tomcat 5.5\

Since in my program there are files are written and read, the path is important. And i need to debug the code under eclipse. I can not change the pathes each time when i switched back to eclipse.

I hope u understand what i mean. That must be a configure problem, but i just can not figure it out.

I know the answer may be only several words, but plz dont save them, i need them urgently!

Thanks!

db
