```
B.  
Registry registry = LocateRegistry.getRegistry();  
registry.rebind("aName", astubObject);
```

It seems A has to use a port, which may need a special setting over firewall; for B, what's the port number?

1099 by default.

what about if 1099 already in used?

It shouldn't be because it is reserved by IANA for the RMI Registry. So if it's in use it **should** mean that the RMI Registry is already running.

what significant difference between A & B?

The significant difference is that A starts the registry on port 'defport' and B assumes it is already running on port 1099.

.
