Oops! That was a dumb suggestion; you are not accessing the database from the network.

That is my target! :-)

So far, if I type http://192.168.1.55/folder_name/servlet_name on a different host of my LAN, I get: ERROR 404 (page not found). That is: web server not found, in fact, in a local environment, that page appears (and the servlet itself runs).
