Hi

I have a mapped class called Position that have a field called max. I want to update this field with a HQL sentence with Hibernate version 3.0:

```
Session session = sessionFactory.openSession();
String s = "update Position set max=1 where stock=1";
Query query = session.createQuery(s);
int i = query.executeUpdate();
```

When I execute this code I get an error:

```
*** WARNING: Keyword 'max' is being interpreted as an identifier due
to: expecting IDENT, found 'max'
Error: null
```

I thnig that hibernate is confused with the SQL MAX function. Is there any way to execute this without change the field class?

I have tried with this too:

```
String s = "update Position p set p.max=1 where p.stock=1";
*** ERROR: line 1:16: expecting "set", found 'p'
```

```
String s = "update Position as p set p.max=1 where p.stock=1";
*** ERROR: line 1:16: expecting "set", found 'as'
```

```
String s = "update Position set {max}=1 where stock=1";
unexpected char: '{' [update Posicio set {max}=1 where tock=1]
```

Thanks

David
