Morning all,

Im working right now on a problem that i created.

We have a jsp file which is used to print a formatted output to the screen. This jsp file was written with all the code basically on the same like, when the line wrapped a `<%-- --%>` was used to escape the return character because the result i get now that ive reformatted it is:

--  
ObjectID

:

89

Title:

The Object

-----  
and so on.

Does anyone know how to make a jsp page ignore formatting done simply to lay the code out in a more understandable way?

.
