convenient way to read text file multiple times without reopening it

Hi,

I suppose that a convenient way to read text file is through FileReader.
But FileReader does not support the reset().
So, as a temporal remedy, I am opening the file twice:

```
Reader fr = new FileReader("filename");  
.....  
fr.close();  
.....  
fr = new FileReader("filename");  
.....
```

Of course this is not a clean way. At least, the file could possibly be removed or renamed by another program between the two calls to "new FileReader()". So I want to open the file once and then read it (sequentially) twice.

I suppose Java provides a convenient way for doing it, but I'm unable to figure it out.

Thank you for pointing me the right way!

Tomas
