The default mouse delivered by Apple is the Mighty Mouse, which has four buttons.

Is that the one whose scroll-wheel is actually a scroll-*\*ball\**?

It drove someone I know mad, because when surfing and scrolling down the page, an inadverted drifting sideways suddenly caused the browser to go back/forward in the browsing history. That's of course not a fault of the mighty mouse, but rather poor usability-design on browser's part.

Btw., that guy's (G5-)mainboard snuffed it after little more than two years of age, and he isn't likely to buy electronic waste from that company again any time soon.
