hi,

I have developed a small eclipse application. I want to integrate javafx with it.

I used the eclipse view's "composite" as the frame for the javafx application i developed, say a frame has a canvas which inturn has a rectangle.

Integration using the following code which i found in the net,

```
var frame = SWT_AWT.new_Frame(composite);
```

where the composite is the eclipse view's composite. And all fx components on fx's rootpane component and added it to the frame using,

```
frame.add(rootpane.getComponent());
```

This worked out excepting for Popupmenus. When i click for popupmenus, it shows and disappears. Other mouse click and drag options are working fine.

But if the frame is changed to javafx frame , all popup menus work fine. But i need it to be embedded within the view which wants an SWT\_AWT base frame.

Can anybody suggest me something on this??

Sukanya
