You are using DIV tags which Explorer treats a little differently from Netscape. If you declare your styles like this:

```
<style>
    .bild {position:absolute;top:70px;left:630px}
...
</style>
```

and use them like this:

```
<div class="bild"> ...
```

It ought to work okay. I'm not sure about using absolute positions, they may not be very portable across browsers.

On both of these (as others have said) you cannot do much. The arrangement is that you post something on the web for people to access. They are running your material on their machines (not yours). This means they have to download the source code and they have to download the images. What they do with them after that is no longer under your control (hey, you are assuming they are using a browser, they might have something else instead).

All you can do is put proper copyright notices on your page (and you

comp.lang.java: Re: My webpage

have). Some people disable the right click button so it is harder to 'save image as' but this is easily bypassed.
