Intel Mac version? Does this mean Allegro CL is not able to produce Universal applications?

What is a universal application?
No it is not a cross compiler.
You need a version for the platform you choose.

And pay once a again a few thousand Dollar per developer seat. Hey man this sucks.
The vendors should really offer a one license for all platforms schema.

honestly why? what is in it for them? Also why should the linux people have to buy a windows license and the other way also.

Now lets look at a 10 developer project, 10 linux seats and 2 each mac and windows for porting. 14 seats total. And the number of purchased licences is a good guide on where to put your development dollars.

And since you are talking about allegro, do not worry about developer seats but runtime licensing.
