The one you want is Cello, now based on Tk/Tcl and OpenGL. Full event stream, true callbacks, access to the many Tk/Tcl libs, and terrific portability (of more than just the native look/feel GUI -- sockets, threads, file manager services, the whole Tcl language really.

Usenet: Where others tell me what I want.

Seriously, both cells-gtk and Cello sound like something worth looking at for someone interested in "normal" graphical user interfaces.

But perhaps I also like CLIM, now based on GTK+ and Cairo. Full command objects, true presentations, access to many Lisp libraries, and terrific portability (it works on my Linux), sockets not something it cares about, but has threads, a flexi-trivial dired, and no Tcl at all.

CG is just win32 and for all I know they have more users on Gtk (or not doing GUIs at all).

Allegro 8.0 has a GTK+-based CG for Linux.
