

Got "broken pipe" exception

I am using Edi's libraries like drakma, chungu based on usocket-0.3.5.

As this looks more like a general network question and might not be related to Edi's libraries, I am asking it here looking for any ideas why it might be happening.

Basically I form an http-request to some server and at times it gives me the "broken pipe" exception.

I read that this exception happens when the server terminates the connection on its end and the client still tries to use the socket.

I am wondering if you guys had it and how did you go about fixing it?

Could it be just because the server to which I am trying to connect just dis-behaves? Or could it be some unstable network connection related to my router (linksys) or NIC?

I am using linux 2.6 kernel (debian), sbcl 1.0.11 and the latest drakma related libraries.

Any ideas are welcome!

Andrew
