But I would definately for banning the spammers like those MI5 idiot
and the toad.

Slobodan

and the Jew-Haters and the religious fanatics, and the next group of
toxic wash that wanders by.

But your argument that trolls are good for the ecosystem is
interesting. I agree, impotent, harmless trolls could be tolerated.

Few things for a potential forum software:

1. Include a search for previous posts whe there's new thread, like in ubuntu forums. Many times I tried to ask something but when I wrote the title of the thread system just showed me old releveant answers , that will cut a lot of noise.
2. Rating system, there's a good people, bad people and good people with bad day.

I think that everybody should be allowed to join the forum as that's the core of open societies, with prevention from automatic subscription, but they should get something like few personal fouls credit. When you lose them all you're gone. With time of good behaviour they should be refilled.

2. Spam button

Whenever users encounter a post they consider a spam they will just press spam button, and it'll show in the post that it's marked as such, if there are more than 3 votes and 2/3 think it's spom post

Re: webapps, why so hard

will be deleted and poster will lose credit.

3. Killfile user

All threads started certain user and all his replies and replies to his replies will be invisible to those who exercised that option.

Of course this is just an idea finding good numbers for credits and pardon time is left as an exercise to the reader.

cheers

Slobodan
