Here's an example:

<http://www.jwscripts.com/playground/ticker.phps>

This example does not include caching of the xml, so with each page request the xml file is retrieved from the remote host.

Caching is always a good idea, so read the online manual to catch up with appropriate functions like:

`file_put_contents`
`filetime`

Also, the applied `file_get_contents` function doesn't support timeouts (means that your script will hang when the remote host doesn't respond).

See the manual entry on `fsockopen` to read about a function that does.
