Joe Joe wrote:

```
$headers .= "To: <".$email.">\r\n"; $headers .= "From:
".$from.">\r\n"; mail($to, $subject, $message, $headers);
echo $from.' '.$email.' '.$title.' '.$message;
*/
```

Do you set \$to at all or do you rely on headers?

What happens if you don't set To: etc. in the headers, but instead use:

```
mail($email, $subject, $message, $headers);
```

Grtz,
