Dear PHP Group,

I have two forms that are used to collect user information. The first one takes user inputted values such as fullname, city, address etc. I want these values to display in the second form when it is called. Both forms are .htm files that call themselves when the submit button is press via the following command in each form:

```
<form method="post" action="<?php $server['PHP_SELF']?>">
```

The server is set to parse .htm files as php. Everything else is working fine and all the validation checks are working fine. Based on certain validation checks that are within the form php code, the user is either left on the input form page to correct errors or if there are no errors the user is passed to the next form via a Java call....

```
<script language="javascript">
<!--
  location.replace("order2.htm");
-->
</script>
```

I have even put a `session_write_close()` before the redirect hoping this would fix the problem of not displaying the inputted values from the first form into the second form.

The server value for global variables is set to ON.

In the second form I have tried to display the values from the first form after the POST using the following three methods:

```
$fullname;
echo $HTTP_POST_VARS['fullname'];
echo $_POST['fullname'];
```

Nothing works...

comp.lang.php: Values not displaying in second form after post.

Any ideas why I cannot get the values from the first form to display on the second form?

Thanks in advance!
