comp.lang.php: Re: password protection – does this work?

```
> $password = $_GET['password'];  
> to retrieve the passed value of password
```

well, yeah, I know all about that (and I am using obviously post in my password form), what I'm saying is it works without \$\_POST['password']. the script above is exactly what I'm using, from the top. yeah, I just tested it, if I put "?password=secretword" in the address bar, I am 'logged in'. So, I'm wondering if there's some special circumstances where you need to use \$\_POST[] and \$\_GET[] to get those values. Maybe older versions of php?
