By your local machine they mean your own computer where you would need to have PHP, Apache and (probably) MySQL installed. I have a seperate Linux server here that I use to test my own scripts, but its certainly possible to set up the required software on your windows machine (if thats what you're using).

One such package which might help can be found here – <http://www.easyphp.org/> – but there are quite a few like this so its up to you which you want to use.

Of course if your script runs fine on your local machine then the reason could be version related, or any number of other things so it still comes down to you needing to see the error log on your ISPs server...
