Hi,

I wrote a simple script utilizing `readdir()` to read the contents of a directory, then of all subdirectories and thier contents and echo the filenames to the page.

But, here is the problem. I'm also echo'ing `filtype()` to ensure only files and not the directory names are printed. But I've noticed some of the files are not returning a type.

Has anyone seen this before? Am I just crazy?

Thanks for your help,

Kevin
