Bit Byte napisal(a):

I have written a number of PHP include files. I have carefully partitioned them into logical folders – based on functionality. My directory structure looks something like this:

```
$(rootdir)/includes/  
$(rootdir)/includes/patterns  
$(rootdir)/includes/core/db  
$(rootdir)/includes/core/utils  
$(rootdir)/includes/core/logger
```

...

etc.

Each folder contains one or more files. I wrote the following script to test my db classes:

```
<?php  
echo "In script\n" ;  
include ("db/mysql_database.inc.php");  
echo "Got here\n" ;  
  
try  
{  
echo "Attempting to instantiate db object\n" ;  
$m_dbconnection = new MySQLDatabase();  
echo "Object created succesfully\n" ;  
}  
catch (Exception $e)  
{  
echo "Exception caught : " . $e->getMessage() . "\n" ;  
}  
?>
```

Output: "In script Got here Attempting to instantiate db object "

I cannot, for the life of me, work out wtf is wrong iwth the script, and

Re: require_once() driving me MAD ! – please HELP

why I can't seem to use my directory structure. The above script is being run from \$(rootdir). \$(rootdir) is in folder htdocs under Apache.

Why do you think it's a directory structure problem? You wrote that in the output you get only "In script Got here Attempting to instantiate db object ", so it stops in MySQLDatabase. Maybe there is an error.

.
