This may or may not be the correct place to discuss my question; if not, please direct me.

I am using the ezPDF library to dump the contents of a table into a PDF with the function:

```
$pdf->ezTable(array_of_values);
```

The problem is that if the array is too large, it bleeds onto the next page. This would be fine, but I created custom headers and footers that appear on each page, but sometimes are covered up by the table, if that makes any sense. The question, then, is whether or not it is possible to automatically set the table to paginate upon reaching a certain size (thereby not covering up the header and footer) or if I must determine the size myself and create multiple tables.

Thanks for any help.
