Suppose I have a bunch of DOM objects (namely images) and want to pass the attributes of these DOM objects to a PHP script. What is the easiest way to accomplish this? Basically, I have a bunch of images that can be manipulated by Javascript and want to determine their final locations after the user is done moving them. For instance, one of the attributes might be `dd.elements.circle1.h`, where `h` is the height of the image named `circle1`. This height is set when the page is loaded, but may change as the user manipulates the circle. Would I be better off just writing a bunch of form data then passing this to PHP? I vaguely remember seeing something about manipulating session variables with Javascript.

Thanks for any help.
