Now this is just a guess, but if 'june' comes from an array starting with zero, so that 0=janeary, then 4=may and 5=june, it probably should start from 1=janeary and in that case 5 would actually be may... If that doesn't help, see the whole output of getdate with print_r() and post the result here.

How can any one start counting from something else than zero in computer applications?

Standards are GREAT. And, you have so many to chose from!

Thanks! I'm so very, very stupid.

I don't think so. As someone who has worked his way through *A LOT* of programming languages since 1966, "Counting from 0/1" is just one of the 'standards' I never take for granted. (And, I still screw up....)

Jonesy

Re: Interesting date

Re: Interesting date

I seem to remember that back in the C64 days you could actually tell the script (program) to start at 0 or 1 if you wanted. I can't remember what that command was though...

Norm

VB6 allowed you to put the "Option Base 1" directive at the top of a module to achieve the same result. Scary that I remember that...
