I have 2 statements that I'd like to string together in a query, but according to everything I'm seeing, it's not possible. What I'm doing is an insert of a row, where the primary key is an auto increment. I want to retrieve that by using LAST_INSERT_ID(). I tried sending another query after the first (once I knew that it the data was what I need) but it didn't return anything. It seems that that function can't be used in separate calls or something. Either that or there's a setting that I need to check. Any ideas?

If you're trying to return the last inserted row on a table with an auto increment field all you have to do is query the maximum value in that field.

And if you have two people insert at the same time one is going to get the wrong value.

A terrible way to do it!
