I tried the Class and it looks to be able to send POST data to a page and request back the results. I am looking to actually goto the page as if you had clicked on the link. I basically created an app that sometimes tries to send data to a page that exceeds the max length allowed in the URL. What are options for getting around that limit. I could see using a form if I had just one link, but I have hundreds and can't think of a way to just send the data from the link I click on if I used a form.

I think the limit is in the browsers, something like 255 characters. So I think you can submit a GET request using that class to an URL without that limit.

There are also buffer limits in the web servers. For sending large amounts of data to a script POST is the correct way.
