Hi,

I hav created a newsletter creator, that will will the out put as a PDF to the user
User can select some articles with one template

And we will merge the articles with templates to generate simple HTML (using Table in HTML)

First i went with FPDF

it given almost fine result except two problems

- 1) We cant give ant font or CSS for the whole pdf everything will be in same font (can negotiate though)
- 2) i created the article in row wise. so each article content will come in each row
but its breaking(Skipping) the page when it found that it will not be fit in the remaining part of the current page

Then i went for html2ps

It is working quit well with all the above two problems

But it giving an error when i go for little bit large contents (we may able to fix if we got the server with us)
the second error is with images . they are told that we may need to give absolute path if inserts images
but still we arn't

Please help me out of this two
in which i should go with..??
and where i should be concentrated more??

Regards
Anees

.
