I tried to post this earlier, and I think I failed; sorry about the double posting if I'm wrong...

```
Connect to server and select database all in one step=====
require('Code/metaconnectstring.php'); ||
```

When I use my home php/Apache local network I get the very nice error message below: [php 4.2.7]

Parse error: parse error in /Users/xxx/Sites/theprogram.php on line 47

But on the network where the thing is supposed to run [php 5.2.?] the same error produced nothing but a blank screen even though I had error reporting set to E_ALL and error display on. [I have seen enough other error messages and 'Notices' there to know that error reporting is on] Is there yet another parameter that I need to set?

thanks, --thelma
