Hello,

I have a index.php template (2 columns). The right columns contains a bunch of links (interviews, poems, etc...) The left columns contains the actual article.

So if I click on a link on the right menu, the article shows on the left column.

The links have an url that look like this:

<http://www.myweb/library/?doc=194uf7s39>

So far, no problem. Everything works like it should.

Here's the question or needed advice. I have more then a thousand articles (in diferent categories) and i want to know what is the best way to create those articles. Should i create a PHP file for each one? Should i create a text file in notepad for each article? Should create a 'funny' html for each article?

Maybe create an XML file for each article. I can't use MYSQL in this case for portability reasons.

Each articles contains mostly text, photos, links to other articles. Most articles are from paper and thought needs to be digitalize in some way.

Keep in mind that most articles contains special characters (á, é í...)

I need advice on this issue. I want to use the right method before starting importing all those articles. I want to get it right the first time.

Any advice?

Thanks in advance
Marco
