Dear All,

Please comment on Best Practices for sharing members database between different portals.

Suppose we have 3 portals running on different networks.

Assignment is to make a single Login/Pass for all portals, means once LoggedIn in one of the portal, could able to access the other portals without logging In.

Constraints are, every portal have different Database structure and also have different Global / Session variables.

Please share your experience and which approach is the best practice.

Regards,

TM
