If I'm not mistaken, I would need to do a bunch of re-writing of PHP to get it to compile for the Palm, and I'd probably need to write a front end of some type. I'm not that kind of programmer, but I could deal with compiling from source myself if it were that simple. Thoughts? Comments? Anybody want to help start "palm-php" on sourceforge? (I'm half joking about the last thing, but I am also half serious – anybody interested?)

As far as the Sharp Zaurus, yes, I have looked into it. Linux in the pocket is pretty appealing. But the Palm is much more ubiquitous and available in more forms (many sizes of pdas, cell phones, even watches now), so php for the Palm would be more useful. Plus, they already have source and binaries of php, apache, etc for the Zaurus, but not for the Palm, at least that I can find.

Any other ideas?
