-

I feel stupid. I have pghCoder (pr2). I have somehow made the whole panel that displays the PROJECT (the files, documentation tabs ect.) GO AWAY. I was clicking items in the main menus when this happened. I cannot seem to discover a setting someplace to get the panel to reappear. I had copied whole programs installation folder to a CD about a week ago. I copied it back to the hard drive hoping that would solve the problem, but NO. Even the backup copy from CD shows the same issue. Is there a config or ..ini file someplace I have not discovered?

PLEASE HELP. thanks
DavidF.
