Hey all!

Quick question (and hopefully a simple one)

I have a link on a page, when the client clicks that link it should show them a JS prompt and ask for their name (so far I have done this)

When they write their name, I want that data to be sent to my php script via AJAX (yes?) so the page does not reload or anything.... (actually, how can i reload the page to reflect the change?)

I have googled but I see whole ajax classes and what not, I dont know if I am using the correct keywords or what... you would happen to have a working piece of code that you could share with me.. would you?

Thanks!  
Ryan

Google Ajax How-to or Ajax How-to POST

The 3rd or 4th item for plain how-to is:  
<http://swik.net/Ajax/How+to+use+XMLHttpRequest>

This first item for how-to POST:  
<http://www.captain.at/howto-ajax-form-post-request.php>
