Hi,

This is a newbie question. I am using a text for learning php/mysql.

I am using PHP 5.2.x and mysql 5.

The example is that of a mysql

database of jokes. Before we get to joins there is a

simple table with 3 fields, ID field (primary key, integer),

JokeText, and JokeDate. In the program for some

reason the code is not retrieving the ID for each

row from the db. It gets the JokeText field just fine.

Let me include the snippets below.

This is where each row (each joke) is to be displayed.

Note that the ID is used to give the option of deleting a

joke from the db. The link tag is supposed to get that

ID passed to the link but that isn't happening. Please help.

```
// Display the text of each joke in the paragraph
while ( $row = mysql_fetch_array($result) ) {
$jokeid = $row["ID"];
echo ($row["ID"]);
$deletejoke=$jokeid;
$joketext = $row["JokeText"];
$thispage = $_SERVER["PHP_SELF"];
echo("<p>$joketext " .
"<a href='$thispage?deletejoke=$jokeid'>" .
"Delete this Joke</a></p>");
}
```

Then the code to delete the joke (the row from the db) is as follows:

```
// If a joke has been deleted,
// remove it from the database
if (isset($_GET['deletejoke'])) {
$deletejoke=$_GET['deletejoke'];
echo("<p>The joke to delete is number $deletejoke");
$sql = "DELETE FROM jokes " .
"WHERE ID=$deletejoke";
if (mysql_query($sql)) {
echo("<p>The joke has been deleted.</p>");
}
```

```
} else {  
echo("<p>Error deleting joke: " .  
mysql_error() . "</p>");  
}  
}
```

Thanks in advance for any help,
Bruce
