Ok, thanks for info, i've downloaded the MailEnable SW for free and i was able to check that my PHP mail function really send correctly emails :-)
thanks a lot,

A.

Hi,

i know that this is not necessary the best forum for that, but i need

to get

a real feedback and i guess you already faced the same issue as mine.
basically, i develop php web application on windows XP platform.
So i have apache 2.24 installed and PHP 5.2.4.

now i would like to test if my application send emails, so i've checked

my

php.ini file and it seems ok.
i tried to use IIS from windows to define a default SMTP server, but as

my

emails are not sent, i guess something is wrong with IIS.

So which HTTP server are you using? You stated earlier that you have Apache 2.24 on there, but here you say that you're using IIS. If you're using Apache, the IIS web server configuration will have nothing to do with anything.

Re: [PHP] SMTP

so does it exist a free SMTP server (similar that linux daemon) but
running

on windows XP ?

I may be incorrect on this, but I'm pretty sure that Win2K/XP/Vista have Microsoft Exchange bundled in for SMTP. Check in Add/Remove Programs > Windows Components > Internet Information Services (I think, but I'm guessing.... I really don't use Windows that often). Even though it has the same name (IIS), in this case, it's the category for all Internet services. There should be something mentioning SMTP there.

if yes, where can i find it and what steps should i perform to be sure

my
