Hi all,

Ok, I'm still a newbie (hopefully, someday I'll be past this stage), so don't get too upset and also, if you can provide some assistance, I guess you'll have to give a step by step description from a beginner's point of view.

The question: How can I check to be sure cURL is enabled?

I'm on a MacBookPro running OS X 10.4.11. My PHP version is 5.1.4. Apache is version 1.3.33

Let me know if you need more information.

Kista
