Hello everyone.

I like the Dbdeploy utility very much, but I there isn't any possibilities to use it on usual, shared LAMP hosting, because it can be run only from command line, as usual Apache ant task, which looks like this:

```
<dbdeploy driver="${db.driver}" url="${db.url}"
userid="${db.user}" password="${db.password}"
dir="${input.sql.dir}" outputfile="${build.outdir}\$
{build.deltascript}"
dbms="mysql" deltaset="DLM"
undoOutputfile="${build.outdir}\${build.undoscript}" />
```

It is very inconvenient to execute these sql-deltas, manually. Especially if project is big, and we need to make a version upgrade fast.

It is possible to write that mechanism by our own, as a php script, getting .sql files, from some directory, and execute them, if they weren't be executed, BUT I'm wondering, if that tool has been already developed.

Thanks, Nikita
