If it's a simple $x < y$, you might want to consider putting your if statement in the SQL query so you don't return so many rows. To make a counter, just set a variable like:

```
$counter = 0;
```

```
if ($x < $y)
{
print $row;
$counter++
}
```

Thank you,

I have been working on the something for the last day and can't figure it out.

I am pulling 7500 rows from a MySQL database, but I only want to display a certain numbers of rows based up an if statement. I want to count the rows within the if statement.

mysql query result

```
if(x < y){
```

Re: [PHP] Counting Occurrences within an If statement

display a row in a table

```
}else{
```

Don't display anything

```
}
```

Every time a row is displayed, I want to add one to a counter
