i'm just acquainted to this php -mysql not so long. i have several issues i came across while developing my own localhost site.

1) what command i should use to show query time, such as shown automatically on prompt.

(Query took 0.3435 sec)

I have seen sql and php manual but none addressed this issue.

2) i connected to db with `mysql_pconnect()` however without storing the return value. Later i tried to close several opened connection numbers which were shown :

```
$p = mysql_list_processes();  
while ($row = mysql_fetch_row($p)) {  
list($id,...) = $row;  
echo "link: $id<br/>";  
}
```

there were several numbers shown from \$id. Assuming 5,6, 10 were listed, i thought i was able to close any numbers thereof and i picked up value 5 and executed `mysql_close(5)`; and later i checked with `mysql_list_processes`. connection number 5 was still active. how should i do to close this connection, does this relate to persistent connection ?

.
