Hi all, the simple code snippet:

```
header('Content-type: image/gif');
$im = imagecreatefromgif("/path/Mypic.gif");
$background = imagecolorallocate($im, 255, 255, 255);
imagecolortransparent($im,$background);

imagegif($im,'/path/TransparentPic.gif');
imagedestroy($im);
```

is creating the new image but is not setting the white background to transparent;

I am sure about the presence of the white color in the background (checked it with `imagecolorat()` etc).

a similarly simple test setting transparency on a new image created with `'imagecreatetruecolor()'` works correctly... any hints?!

Cheers, Luca
