I'm trying to use LWP to scrape some data from a web site fronting a database of some sort (don't really know/care what). To use the site from a browser you enter (at some point you get a session cookie, not really sure when) and proceed to navigate through many pages (they are all frames with the top part having various navigation widgets and the bottom part having both visible and hidden forms – the hidden forms are used to hold data being entered through the process). As each page is navigated, the site sends various cookies (many) and refreshes the hidden form. When all is said and done a form is POSTed to retrieve the data (data is actually a .csv file, but that doesn't matter). The navigation to the final POST always creates the same hidden form data. I've used `wsp` and `template.pl` to figure out what is happening and build a perl app that works, at least until the session cookie expires!! That's the rub.

How do I find out which of the MANY cookies is the ONE that I must refresh?

How do I refresh it?

Thanks for any help.

R
