Hi,

I have been trying to instal the String::CRC32 module, but so far have been unsuccessful.

I am running ActiveState Perl 5,8,1,807 on Win XP.

I have attempted to install using the ppm3 tool, however this is unable to find the package in any of the installed repositories (2 at ActiveState, 1 at uwinnipeg.ca & 1 at roth.net)

I have also attempted manual instalation by downloading String-CRC32-1.2.tar.gz . Follwoing the README perl Makefile.PL runs fine, but running make returns error

makefile:340: \*\*\* multiple target patterns. Stop.

I have tried using Cygwin's & WinGW's make as wel as MS nmake (as packaged with MS VC++ 6) – they all return the same error.

I'd be really grateful if anyone could offer a bit of advice on how to resolve my problem.

Cheers,  
Andy.

PS Peculiar thing is I am sure I had previously installed this package using ppm3 without hassles some months back (same ver of ActivePerl), but following a rebuild of PC I'm snookered :(
