It would be great if any one can help me in the problem i faced below, I got stuck here and have to find out some alternative here.

Thanks.

Hi,

You understand the problem correctly. I wanted to get the path for httpd.conf file when the System boots up and my daemon will parse the httpd.conf file to get the Server Address and the port number and some additional information from where your Server runs. I wanted to show this information to the user So that they can directly change their configuration rather than editing the file, I have reached till the steps where i can look for /etc/rc.d/rc3.d for httpd and apache files but seems for each vendor these files are written differently and i can not found the exact httpd.conf file. Please suggest what you say.

Thanks,
