I have a perl script that parses an email.

I use mutt and then just use the pipe command.

I would like to be able to pipe the output of my script then to mutt to send the parsed email to someone else.

I can do this in mutt but just hitting the pipe char then typeing the name of my script then | again and the mutt syntax.

The only problem is thats kind of lengthy i would like to have a script wrap my script that would have the mutt command built into it.

or better yet just in the normal script pipe the out put of script to mutt instead of stdout.

I know this can be done but for the life of me can't find it.
