Hi

I have the next problem. The person push a button for <set value>, how do I get 'n popup windows with three values.

\$opt_t, \$opt_v,\$opt_c. It has to open a file with that criteria, and have to create a file to save errors to with that criteria. It is for the usage that they have set.

example of values : my \$usage =

```
                                "Usage: $0
[OPTION]\\.\\.\\.
                                -v Version
Version Nommer van leksikon
                                -V Version
Nuwe version nommer
                                -t Taal
Taal van leksikon
                                -c Case
Case van file waarmee werk
                                -h
Show this help and
```

";

they then open the file as follow : open(KORREK,
"<\$opt_t.\$opt_v.\$opt_c.cwords.txt") or die "\$!: Korrek.uc.txt\n";

and they send the tested result to : open(KORREK1,
">\$opt_t.\$opt_v.\$opt_c.Reg vir leksikon.txt") or die "\$!:
Korrek1.uc.txt\n";

and then they write to the created file : foreach my \$l (sort
keys %korrek){

```
    print KORREK1 "$l\n";
```

perl.beginners: Set value

}

I want them to set the value and test the files. The the output file should be written with the values and the name.

Thanx
