Looking over the available documentation, it seems that Term::Complete exports exactly one function: "Complete([prompt], [@completion_list]).

Therefore, there shouldn't be any need to specify the function that is being imported, as there is only one function to import.

That that, it seems, could be the problem: the function provides "Complete", with a capital "C". This error refers to "complete", with a lowercase "c". Fixing the case may resolve the problem.
