[a request for the explanation about the behaviour of ++ on alphabetic strings]

As a beginner you are in a unique position to help the Perl community improve Perl's documentation. Since, clearly, you find the explanation of ++ in the reference manual to be unclear could you perhaps explain precisely which parts of it you difficult to comprehend so that we can improve it.

Alternatively if you were unable to find the relevant documentation could you explain the steps you took to look for it so that we might improve the documentation to make it easier to find what you are looking for.
