Hi List

Maybe a this question is a bit odd for this list, but i guess someone here has had the same problem:

Im doing a natural language project with CHR andim writing in Ultraedit.

I want to print out my code so it can go into my report. But i want it to be read with the long side of the paper to get as long lines as possible. My solution until now has been to copy around 40 lines into Photoshop and re-type all tabs (since tab=space in this program), then rotate the picture and print it. It looks fine but its a mess and takes too much time.

Anyone did this?

Thanks in advance
Sune
