I am not sure about this but I believe you can give a parameter `after="sheet1"` to `Add()`, like so, `Add(after="sheet1")`.

Unfortunately I do not have Excel installed on this machine to confirm this.

A tip: if you have VBA (which you should if you have Excel) installed, lookup the `Add` method for the `Worksheets` collection. VBA will show the code completion, with all the arguments for the method call. Try the same for any of the methods.

Thanks,
