Hi,

I'm really not sure but there might be some way to embed Java Script within Jython. Or to run Jython from inside Java much like the jEdit editor. You then have Python to make some glue code between the C++ core and the Java Script. Java Script must be secure since it runs in browsers everywhere from my worst sex web sites !

I'm not really sure why the original poster want to use Python, I think it's to make the glue between C++ and the scripting engine. Nor am I really sure why java runs inside my browser ...
