that like displays all the items, i want to just get one two three and such. Can't i get just the first three and i also want them to display individually such as title1 = just the title of item 1 and desc = would be the desc of item one, and so one... I dont need a list of all titles... Is there a good tutorial that would show wat i want to do.. i checked and alot of tutorials have basic tutorials that have examples of just one item'd xml's....

thx.

-Jay
